

***What do I want to learn or understand better?***

- A) This week has been very stressful for me, for reasons which are not school-related. Since I am also probably the person with the least amount of programming experience, we agreed that I were to use the little time I had this week to become a bit more familiar with the languages, libraries and programs we aim to use in our project. So that's mostly what I've been trying to do.
- B) I want to become experienced in the programs, libraries and languages we aim to use in this project to the point we're I feel like I'm able to properly contribute in a meaningful way to our deliverables.
- C) It will be important for me when I'm working in groups or by myself to take additional steps to make sure that I understand everything that is being done in the code. I need to ask questions whenever I don't understand, and continuously read up on things that could be of value to our project.

***How can I help someone else, or the entire team, to learn something new?***

- A) When it comes to the technical stuff, I am currently at a disadvantage compared to my other team members. I feel as though it is currently hard to provide new learning opportunities for my team in this department. However, I am probably more experienced when it comes to working in teams, partially due to the many courses with group work in my education program compared to the Information Technology programme.
- B) I want to use my previous experience in group work in different teams to provide structure to our work and to provide the other team members with some concrete tools for handling our work effectively. I'm also hoping that I can become proficient enough in programming so that I can provide at least some new insights and tricks to our other team members.
- C) In regards to the technical aspects, roughly the same as the first question. In regards to the aspects of working in teams, I need to not be afraid to make suggestions of how I think we should go about things, even though everyone may not agree. Fortunately, I think my role as Scrum Master is going to enable me to do this easier.

***What is my contribution towards the team's use of Scrum?***

- A) I have been assigned the role of Scrum Master in our team. This means I'll be keeping track of the overall work direction of the group, keeping track of the trello board and probably having a bit more responsibility for the various meetings during the week.

- B) In my role as a Scrum Master, I want to make sure that we are following all the agile practices which will benefit our team and that we are continuously working within the practices of scrum.
- C) Establish structure during our meetings, and point out whenever we are working ineffectively. Particularly I want to minimize the amount of gold plating in the project and to redirect our work efforts towards value for our Product Owner.

***What is my contribution towards the team's deliveries?***

- A) This week, my contribution towards our user stories have been negligible due to me having a very stressful week. I have of course taken part in the team reflection. I have used the time I had towards trying to prepare myself moving forward, so that I may really contribute in the coming weeks.
- B) The coming weeks will hopefully not be as stressful for me. I want to use what I've tried to catch up in the technical aspects of the work to be able to properly contribute towards our user stories and the value for our PO.
- C) Keep reading up on documentation and watching videos to learn React, Node.js etc. Apply what I've learnt in our User Stories.
